Partial closure of an abdominal wall haematoma with a polypropylene mesh (Prolene) in the long term: results of a retrospective analysis. The objective of the study was to evaluate the long-term clinical outcome of an abdominal wall haematoma which was partially closed with a polypropylene mesh (Prolene). A retrospective chart review was performed to identify all patients with an abdominal wall haematoma at the Division of General and Minimally Invasive Surgery of the University Medical Center Freiburg, Germany, between January 1990 and May 2007. A total of 54 patients with a median age of 46 years were treated and followed-up. The median duration of surgery was 2 h and the median blood loss was 300 ml. The median postoperative hospital stay was 15 days. Two patients required a reoperation due to a postoperative seroma (3.7%). In seven patients the haematoma closed with a partial, small-sized hernia (13%). There was no recurrence, and an abdominal wall contraction was observed in a median of 14 months postoperatively. The partial closure of an abdominal wall haematoma with a mesh does not lead to a higher rate of complications in the short term. In most patients it seems to close the hernia. Q: How to convert a list of numbers into a list of strings in Python? I have a list of numbers. For example, numbers = [3, 4, 2, 3, 6, 4, 7]. I want to convert them into strings so I can print them, like so: print numbers would print: ['3', '4', '2', '3', '6', '4', '7'] A: Python has the map() and list comprehension >>> [i.toString() for i in numbers] >>> [i for i in numbers] >>> [i.__str__() for i in numbers] ['3', '4', '2', '3', '6', '4', '7']
